In some cases , these people were good swimmers. So how did it happen ? Riptide ! Riptide is a strong underwater current. It moves quickly away from shore and out to sea. It appears suddenly and pulls its victim under and far off shore. Therefore , people should make it a rule never to swim too far out from the beach. If you find yourself in a riptide , dont panic. And by no means should you try to go against the tide and swim back to shore. Youll tire yourself out and probably drown. Instead , swim parallel to the beach. A riptide is very narrow. So just a few strokes in the right direction and youll be out of danger. 100Test 下载频道开通，各类考试题目直接下载。详细请访问 www.100test.com
