```
dw_where的 ue_where 事件 功能：形成WHERE子句,并更新语法框。 string hzcol, ywcol, sValue, sType //, sWhere //sWhere 现为实例变量,在wroot_query中为局部变量. string sOper, sLog, sLeft_kh,sRight_kh, tmpsValue long left_kh,right_kh //左、右括号数 integer i, rownum, delnum //, typenum dwItemStatus l_status if ib_changed = true then ib_changed = false else return 0 end if rownum = dw_where.RowCount() //去掉dw_where 中MaxEditRow行以前所有中间为空或 //者输入不完整的行,并更新MaxEditRow. i = 1 delnum = 0 DO WHILE i l_status = dw_where.GetItemStatus(i,0, Primary!) if l_status New! then hzcol = GetItemString(i,"column1") sValue = GetItemString(i,"value") if (hzcol = "" or isnull(hzcol)) or (sValue = "" or isnull(sValue)) then dw_where.DeleteRow(i) delnum = 1 MaxEditRow = -1 Continue end if else dw_where.DeleteRow(i) delnum = 1 MaxEditRow = -1 Continue end if i = 1 LOOP For i = 1 to DelNum dw_where.InsertRow(0) Next //检查左右括号是否匹配,即其数量是否一样多.
