It refers to the descendant of a single plant or animal, produced nonsexually from any one cell. It is true that clone technology is an achievement in science. However, as to its application, different people take different attitudes. Many people are very excited about the success of clone technique. They think it offers the possibilities that human being can breed excellent varieties of plants and animal by making full use of high-grade gene. Hence human beings can benefit a lot from it. Others argue that it is easily misused, which will bring about a disaster. For example, if clone technique is carried out on human beings, it will lead to moral confusion. Moreover, we can ' t predict what disaster it will give rise to. Therefore, it is safe to say that the clone technique in itself is innocent, but once it is misused, its destructive power will be uncontrollable. However, I ' m very pleased to read the reports that scientists are trying to breed clone animals to benefit people. So it is important that we apply the clone technology properly and make it benefit human beings. 100Test 下载频道开通，各类考试题目直接下载。详细请访问 www.100test.com
