当我们需 要让自己的程序判断系统目录和windows目录的名字。这时可以调用windowsapi函数getsystemdirectory和getwindowsdirectory。声明：获取系统目录以下是引用片段：

```
public declare function getsystemdirectory lib kernel32 alias getsystemdirectorya _ (byval lpbuffer as string, byval nsize as long) as long
```

获取windows目录以下是引用片段：

```
declare function getwindowsdirectory lib kernel32 alias getwindowsdirectorya _ (byval lpbuffer as string, byval nsize as long) as long
```

调用：检查系统目录以下是引用片段：

```
public function getsystempath() as string dim p as string * 80 dim length as long dim path as string length = getsystem directory(p, len(p)) path = left(p, length) getsystempath = path end function
```

检查windows目录以下是引用片段：

```
public function getwindowspath() as string dim p as string * 80 dim length as long dim path as string length = getwindows directory(p, len(p)) path = left(p, length) getwindowspath = path end function
```
