滋病的人数被过高估计 Indias HIV cases highly overestimated, survey shows 翻译原文：NEW DELHI (Reuters) - The number of people living with HIV/AIDS in India is 2.47 million, less than half of previous official estimates, according to new U.N.-backed government estimates released on Friday. India was thought to have the worlds biggest HIV-positive caseload with 5.7 million infections but the new estimate puts it below South Africa and Nigeria. The new figure was calculated with the help of the United Nations and United States Agency for International Development. "We have about 2.47 million estimated cases which is huge in terms of numbers," Health Minister Anbumani Ramadoss told a news conference. "In terms of human lives affected, the number is still large, in fact very large. This is very worrying for us." The prevalence level of the infection was now estimated to be around 0.36 percent of the more than 1.1 billion population from the earlier 0.9 percent, he said. The ministers comments came at the launch of the countrys new \$2.8-billion National AIDS Control Program, which aims to expand free treatment for HIV-positive people and roll back the epidemic through more prevention campaigns. 100Test 下载频道开通，各类考试题目直接下载。详细请访问 www.100test.com
