will compile and run, printing out the words "my func" a class that contains an abstract method must be declared abstract itself, but may contain non abstract methods. answer 2)4) the code will compile but

will complain at run time that main is not correctly defined in this example the parameter is a string not a string array as needed for the correct main method answer 3)1) public 2) private 4) transient the

keyword transient is easy to forget as is not frequently used. although a method may be considered to be friendly like in c it is not a java keyword. answer 4)2) the compiler will complain that the base class is

not declared as abstract. if a class contains abstract methods it must itself be declared as abstract answer 5)1) to get to access hardware that java does not know about 3) to write optimised code for performance

in a language such as c/c answer 6)4) success in compilation and output of "a method" at run time. a final method cannot be

overridden in a sub class, but apart from that it does not cause any other restrictions. answer 7)4) compilation and execution without error it would cause a run time error if you had a call to a method
