结构如下: decode (expression, search\_1, result\_1) decode (expression, search\_1, result\_1, search\_2, result\_2) decode (expression, search\_1, result\_1, search\_2, result\_2, ..., search\_n, result\_n) decode (expression, search\_1, result\_1, default) decode (expression, search\_1, result\_1, search\_2, result\_2, default) decode (expression, search\_1, result\_1, search\_2, result\_2, ..., search\_n, result\_n, default) decode函数比较表达式和搜索字，如果匹配，返回结果；如果不匹配，返回default值；如果未定义default值，则返回空值。以下是一个简单测试，用于说明Decode函数的用法:

```
SQL> select * from t.
USERNAME
DEFAULT_TABLESPACE
LOCK_DATE
```

```
-----
SYS SYSTEM SYSTEM SYSTEM OUTLN SYSTEM CSMIG
SYSTEM SCOTT SYSTEM EYGLE USERS DBSNMP SYSTEM
WMSYS SYSTEM 20-OCT-04 8 rows 0selected.
SQL> select
username,decode(lock_date,null, ' unlocked ' ) status from t.
USERNAME STATUS -----
SYS
unlocked SYSTEM unlocked OUTLN unlocked CSMIG unlocked
SCOTT unlocked EYGLE unlocked DBSNMP unlocked WMSYS 8
```
