Hello everyone, I have passed the CCNA 2.0 exam at 2000.8.13. My grade is 870. Exam number is 640-507. It has 65 items. Given time is 135 min, passing score is 822. In my opinion, CCNA 2.0 is a bit harder than MCSE, but not so much if you pass the MCSE by yourself (I mean not dumped). The MCSE course will help you a lot, as the basis of it is very helpful for you to understand the OSI 7 models and TCP/IP subnet addressing. If you are not a MCSE, please study these concepts carefully as it has up to 10 items at least in my exam. I have read my ICND book for three times hardly, and did the boson exam software (it's really a good one). The ICND book is very important as there in my exam are 2-3 items taken from the book without a little change. The following is my memory about the exam: (the words of the question may differ)

1. drag gt.segment--gt.frame-->.bit
2. what command to show hostname with ip address: show host
3. in '100BaseT', what is 'Base' stand for: signal type
4. which three ways will reset the hold timer?
a. HD timer expires
b. the link state has been changed
c. the proportional?? link about the web (I can not remember the details)
5. IP address rule: such as network type
6. IP configuration item about subnetting, 3-4 items (it's easy for MCSE)
7. the concept about the switch type 'fragment free':
a. read the 50% of the data before forward
b. read the all of the data before forward
