The plants operator said radiation levels at the reactor were still within legal limits. The explosion at the plants Unit 3, which authorities have been frantically trying to cool following a system failure in the wake of a massive earthquake and tsunami, triggered an order for hundreds of people to stay indoors, said Chief Cabinet Secretary Yukio Edano. Tokyo Electric Power Co. said radiation levels at Unit 3 were 10.65 microsieverts, significantly under the 500 microsieverts at which a nuclear operator must file a report to the government. The blast follows a similar explosion Saturday that took place at the plants Unit 1, which injured four workers and caused mass-evacuations. Japans nuclear safety agency said 6 workers were injured in Mondays explosion but it was not immediately clear how, or whether they were exposed to radiation. They were all conscious, said the agencies

Ryohei Shomi. The reactor's inner containment vessel holding nuclear rods was intact, Edano said, allaying some fears of the risk to the environment and public. TV footage of the building housing the reactor appeared to show similar damage to Monday's blast, with outer walls shorn off, leaving only a skeletal frame. More than 180,000 people have evacuated the area in recent days, and up to 160 may have been exposed to radiation. Earlier Monday, pressure had jumped inside Unit 3, forcing the evacuation of 21 workers. But they returned to work after levels appeared to ease. Associated Press journalists felt the explosion in the tsunami-devastated port town of Soma, some 25 miles (40 kilometers) north of the reactor. They reported feeling the faint rumble of a blast and the ground shaking. Four nuclear plants in northeastern Japan have reported damage, but the danger was greatest at Fukushima's Dai-ichi plant. Operators have lost the ability to cool three reactors at Dai-ichi and three more at another nearby complex using usual procedures, after the quake knocked out power and the tsunami swamped backup generators. Operators have been dumping seawater into units 1 and 3 in a last-ditch measure to cool the reactors. They were getting water into the other four reactors with cooling problems without resorting to corrosive sea water, which likely makes the reactors unusable. 相关推荐：#0000ff>2011英语四级考试阅读：提高个税起征点 #0000ff>2011年英语四级快速阅读解题思路及方法 为了能及时获取2011年英语四级考试相关信息，建议大家收藏#0000ff>百考试题英语四级考试频道点击收藏，我们会第一时间发布相关信息。 #ff0000> 100Test 下载频道开通，各类考试题目直接
